

With Carma we create a customized Plug-In by building a Structured Template

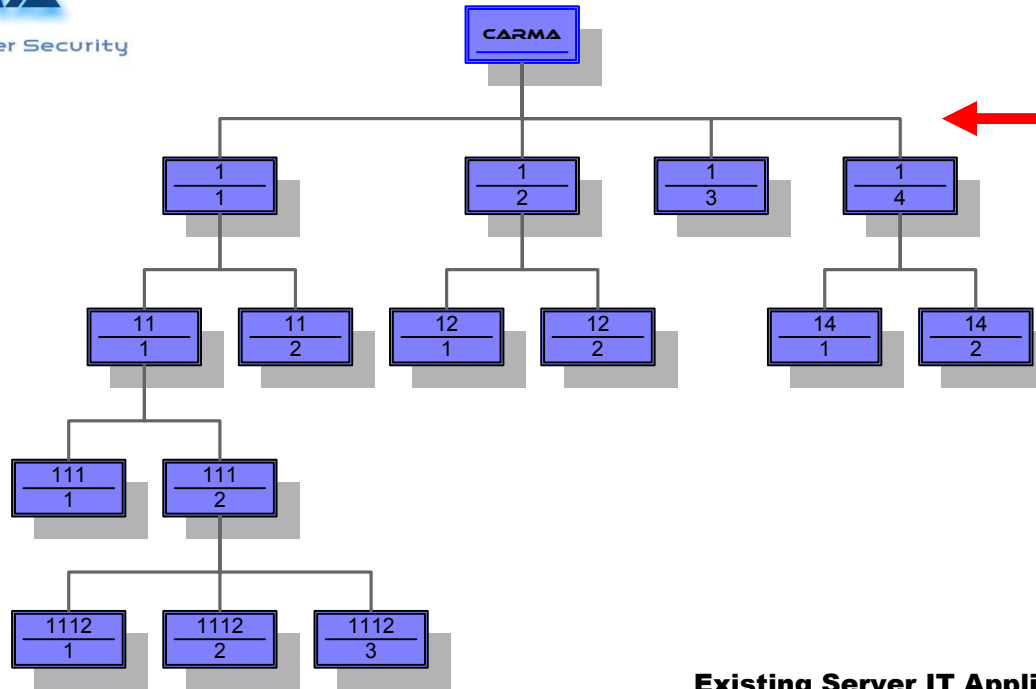

Replicating, consolidating and optimizing the 'Existing Server IT Application & Admin Structure'.

Integrating processes including all system related functions.

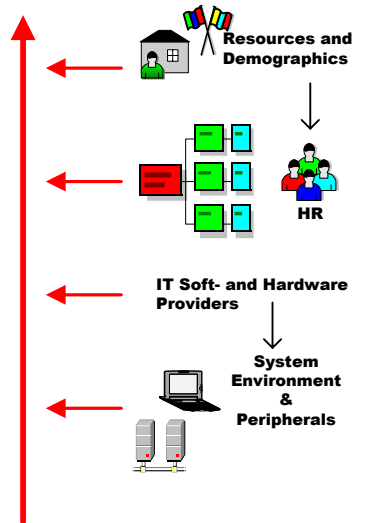

Integrating total resources available, allocating and profiling user, network environment (server, peripherals, supplier) plus allocating privileges and other variables.

Thus, combining access across servers of numerous applications, enterprise systems, system administration, HR, system environment and peripherals to a coherent and uniform entry portal.

Deactivation of CARMA functions like an on-off switch (plug-out), the environment goes back to status quo, running under the same condition as before CARMA's deployment. This might be useful in case of system maintenance, application re-configurations or in any emergency situations.

Structured Template (RDBMS)

Existing Server IT Application & Admin Structure (unorganized)
